

Fast Grass

Ideal winter cover crop and grazing.

- FAST GRASS establishes quickly to provide winter cover and rapid growth even at cool temperatures offering production late into autumn, delivering extra grazing opportunities over winter
- It gives total flexibility with 12, 18 or 24 month production potential and could also be established after a spring cereal harvest
- Can assist with prevention of winter soil erosion
- It has the ability to make use of existing nutrients in the soil after previous crop soaking up N, thus decreasing winter leaching
- Can add organic matter to the soil improving its quality, structure and nutrient holding capacity
- Blending Italian ryegrass with hybrid and perennial ryegrasses ensures the mixture delivers a rounded performance with very rapid establishment, a bottom to the sward, making it denser and very tight heading dates
- Delivers over 18% more in the first year compared to a perennial ryegrass ley

In the bag

50%	Westerwolds
25%	Italian Ryegrass (TET)
25%	Italian Ryegrass (DIP)

Sowing rate per acre: 12 - 15kg per acre

Later production = winter grazing option. Thanks to its ability to germinate at lower temperatures than conventional leys meaning it can be sown safely throughout October, being developed using the concept of 'germination energy' This concept means it will establish faster and better than other leys, even in the adverse conditions, of cold, wet, seed beds which appear later in the year.

- FAST GRASS is a very flexible product that can fit into different regimes as required
- It is equally at home being used as an early spring cut before being ploughed out for a spring sown crop or used as a sacrifice field for early spring grazing as a more cost effective alternative to ryegrass
